

# Single pot synthesis of ordered mesoporous carbon with nanoparticles

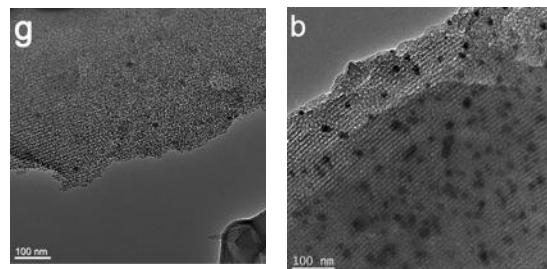

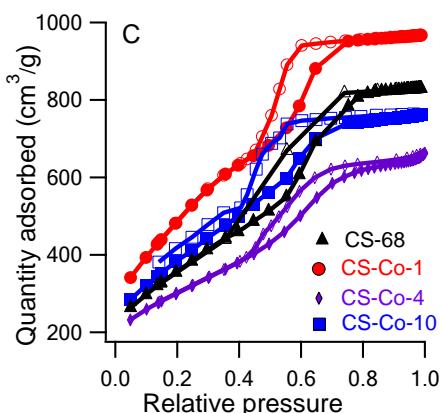

+

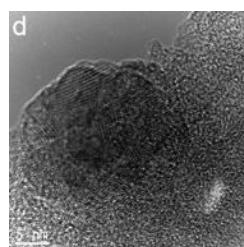

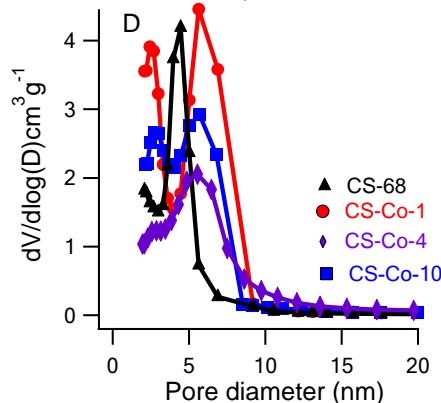

+

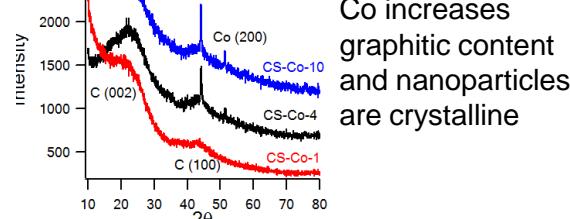

High surface area ordered mesoporous carbon composite (after NaOH etch)

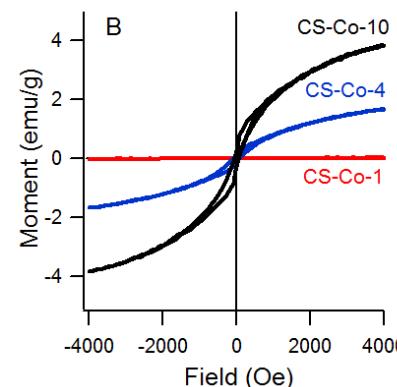

Nanoparticles dispersed in the ordered mesoporous carbon matrix

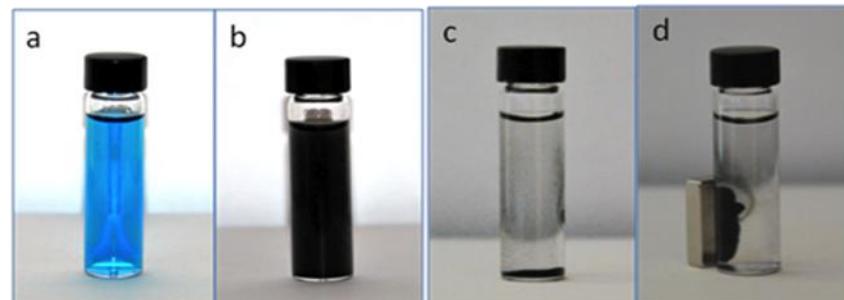

Graphitic shell surrounds Co nanoparticles

Co increases graphitic content and nanoparticles are crystalline

Powders are magnetic with high susceptibility due to small nanoparticle size

Particles are excellent adsorbents and magnetically separable

BET shows narrow pore size distribution with 10 % Co(acac)
